Paper 4 Further Problem-solving and Programming Skills

May/June 2021

2 hours

You must answer on the question paper.

No additional materials are needed.

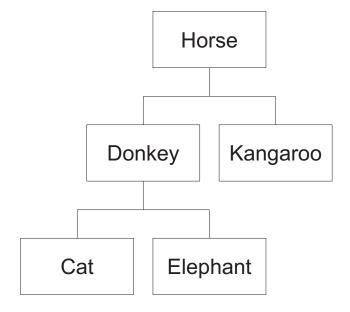

INSTRUCTIONS

- Answer all questions.
- Use a black or dark blue pen.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do not use an erasable pen or correction fluid.
- Do not write on any bar codes.
- You may use an HB pencil for any diagrams, graphs or rough working.
- Calculators must not be used in this paper.

INFORMATION

- The total mark for this paper is 75.
- The number of marks for each question or part question is shown in brackets [].
- No marks will be awarded for using brand names of software packages or hardware.

1 An ordered binary tree stores the following data:

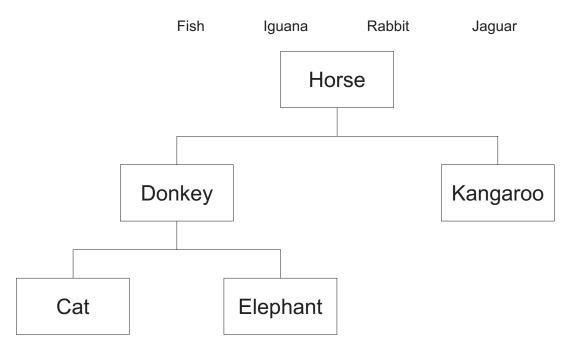

(a) Identify the data in the root node of the binary tree.

[1

(b) Identify the data in one leaf node from the binary tree.

	- 4 -
	11
 	. [1]

(c) Complete the binary tree by adding the following data in the order given:

© UCLES 2021 9608/42/M/J/21

[2]

(d)	Explain how an algorithm will search the binary tree to find Elephant .					
	ro					

2	Λ	company	etoroe	bookings	in a	random	fila
_	$\overline{}$	COILIDALIV	310163	DUUNIIIUS	ша	Talluulli	IIIC.

For each booking, the booking ID, customer ID, item ID and quantity are stored. These four values are all integers.

(a)	Write the pseudocode record declaration for the data type Booking.					
	[2					

(b) Each booking ID is a value between 100 000 and 999 999 inclusive.

The hash value is calculated by dividing the booking ID by 100 000 and adding 3 to the remainder.

(i) The function Hash() takes the booking ID as a parameter, calculates and returns the hash value.

Write program code for the function Hash().
Programming language
Program code
[2]

(ii) Calculate the hash value for each booking ID in the table.

Booking ID	Hash value
5012345	
8212350	

[1]

(c) The function StoreBooking() takes a record as a parameter and stores it in the random file

The Bookings.dat. The function uses Hash() to calculate the hash value for that record. The record is only stored if the value at the hashed value is NULL. FALSE is returned if there is already a record in that location and TRUE otherwise. You can assume that the file exists. Write pseudocode for the function StoreBooking().

(d)	Explain how exception handling can be used when reading from a file.					
	[1					

3 Ejaz is creating a program that will allow the user to create quizzes. He is using object-oriented programming (OOP).

There are two classes: QuestionClass and QuizClass.

The class attributes and methods are in the following tables. All attributes are declared as private.

QuestionClass					
Question : STRING	// stores the question				
Answer : STRING	// stores the correct answer				
Difficulty : INTEGER	<pre>// stores the difficulty as an integer // from 0(easy) to 10(hard)</pre>				
Constructor(QuestionP, AnswerP, DifficultyP)	<pre>// creates an instance of QuestionClass // sets the attributes to the parameter // values</pre>				
GetQuestion()	// returns the question				
GetDifficulty()	// returns the difficulty level				
GetAnswer()	// returns the answer				

QuizClass				
Questions : ARRAY[0:19] OF QuestionClass	<pre>// stores maximum 20 questions of // type QuestionClass</pre>			
NumberOfQuestions : INTEGER	<pre>// stores the number of questions // in this quiz</pre>			
Constructor()	<pre>// creates an instance of // QuizClass // initialises NumberOfQuestions // to 0</pre>			
AddQuestion()	<pre>// adds the parameter question to // the array // increments NumberOfQuestions</pre>			
GetQuestion()	<pre>// returns the next question to be // asked</pre>			
CheckAnswer()	// takes an answer as a parameter // and returns TRUE if correct			

(a)	Write $program\ code$ to define the class <code>QuizClass</code> . You are only required to write code the attribute declarations and constructor.	e foi
	If you are writing in Python, include attribute declarations using comments.	
	Use your programming language's constructor method.	
	Programming language	
	Program code	
		[4]

(b)	The $QuizClass$ method $AddQuestion()$ takes a question object as a parameter and stores it in the next available location in the array $Questions$. It returns TRUE if it is successfully stored, and FALSE otherwise.
	Write program code for the method AddQuestion().
	Programming language
	Program code
	[4]
(c)	The first quiz is created with the identifier FirstQuiz.
	The first question in this quiz is: "What is 100 / 5?".
	The answer is "20" and the difficulty level is 1.
	Write program code to:
	 declare an instance of QuizClass with the identifier FirstQuiz declare an instance of QuestionClass with the identifier Question1 add Question1 to the array in FirstQuiz using AddQuestion().
	Programming language
	Program code

		[5]
(d)	The	object FirstQuiz contains objects of type QuestionClass.
	Stat	e the name of this OOP feature.
		[1]
(e)		z can use an interpreter and a compiler to translate program code during the development cess. The program will be distributed without any access to the source code.
	(i)	State when Ejaz should use an interpreter and a compiler. Each answer must be different.
		Interpreter
		Compiler
		[2]
	(ii)	Give the name of two facilities that Ejaz can use to debug his program.
		1
		2
		[2]
	(iii)	Describe one feature of an editor that Ejaz can use when writing the program.
		[2]

4 Zara is writing a program to simulate a circular queue.

The queue, MyNumbers, has 10 elements. Enqueue() takes a parameter value and stores it at the tail of the queue. Dequeue() returns the item at the head of the queue.

The current state of the circular queue is:

Index	0	1	2	3	4	5	6	7	8	9
Data			31	45	89	500	23	2		

HeadIndex: 2

TailIndex: 8

(a) Show the state of the queue, HeadIndex and TailIndex after the following operations:

Enqueue (23)

Enqueue (100)

Dequeue()

Dequeue()

Enqueue (50)

Index	0	1	2	3	4	5	6	7	8	9
Data										

HeadIndex:

TailIndex:

[3]

(b) The global array, MyNumbers, is used to store the positive integer numbers for the queue.

The following global variables are used:

- HeadIndex stores the index of the first element in the queue
- TailIndex stores the index of the next free space in the queue
- NumberInQueue stores the number of items in the queue.
- (i) The function Enqueue () takes the value to be added to the queue as a parameter. The function returns TRUE if the item was added, or FALSE if the queue is full.

Complete the pseudocode for the function Enqueue ().

ENDFUNCTION

[5]

(ii)	The function <code>Dequeue()</code> returns the value at the head of the queue, or -1 if the queue is empty.
	Complete the pseudocode for the function Dequeue ().
	FUNCTION Dequeue() RETURNS INTEGER
	ENDFUNCTION

[5]

5 The following procedure performs an insertion sort on the global array TheArray that has 10 elements.

Complete the pseudocode for the procedure InsertionSort().

ENDPROCEDURE

[5]

6 A social networking website only allows people who are over 16 years old to join.

To create an account, the user must enter:

- their age
- a unique username, which is compared to others in the database
- a password that must be at least 8 characters long, with at least one upper case letter, one lower case letter, one symbol and one digit.

If the user is not old enough to join the network, the statement "Too young" is displayed.

If the user is old enough, but the username is already taken, the statement "Choose another username" is displayed.

If the user is old enough, but the password does not meet the requirements, the statement "Password does not meet requirements" is displayed.

(a) Complete the decision table for the social networking website.

	Available username	N	Υ	N	Υ	N	Υ	N	Y
Conditions	Suitable password	N	N	Y	Y	N	N	Y	Y
	Age > 16	N	N	N	N	Y	Y	Y	Y
	"Too young"								
Actions	"Choose another username"								
	"Password does not meet requirements"								

[4]

(b) Simplify the decision table by removing the redundancies.

	Available username				
Conditions	Suitable password				
	Age > 16				
	"Too young"				
Actions	"Choose another username"				
	"Password does not meet requirements"				

[3]

7 Anika is designing a computer game. The user controls a character that moves around a virtual world.

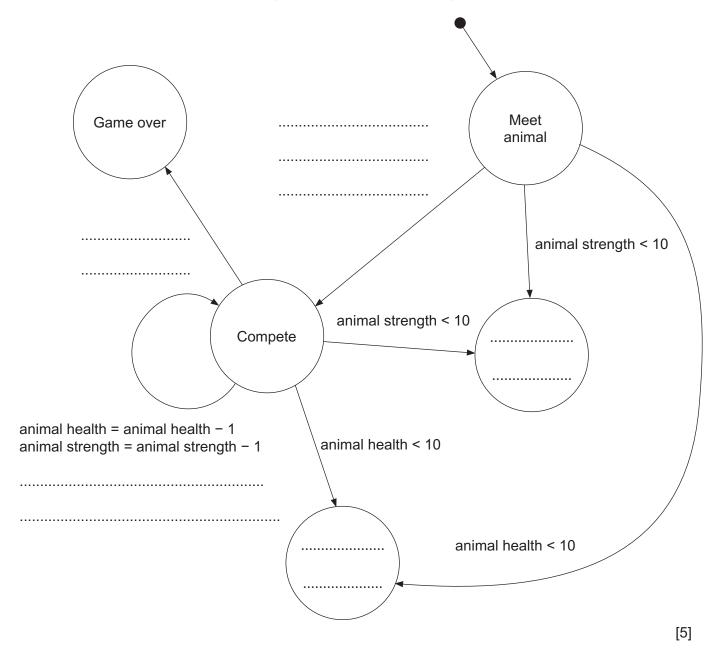

When the character meets an animal:

- if the animal's strength is less than 10, the animal runs away
- if the animal's health is less than 10, it is caught by the character
- if the animal's strength and health are both 10 or more, the character and the animal compete.

When the character and animal compete, the animal's health, animal's strength and character's health are decreased by 1. This is repeated until one of the following conditions is met:

- the character's health goes to 0, the game is over
- the animal's strength goes below 10, the animal runs away
- the animal's health goes below 10, the animal is caught.

Complete the state-transition diagram for this part of the program.

8 The table shows assembly language instructions for a processor that has one general purpose register, the Accumulator (ACC), and an Index Register (IX).

	Instr	ruction	Explanation
Label	Op code Operand		
	LDM	#n	Immediate addressing. Load the number n to ACC
	LDD	<address></address>	Direct addressing. Load the contents of the location at the given address to ACC
	LDX	<address></address>	Indexed addressing. Form the address from <address> + the contents of the Index Register. Copy the contents of this calculated address to ACC</address>
	LDR	#n	Immediate addressing. Load the number n to IX
	STO	<address></address>	Store the contents of ACC at the given address
	ADD	<address></address>	Add the contents of the given address to ACC
	INC	<register></register>	Add 1 to the contents of the register (ACC or IX)
	CMP	#n	Compare the contents of ACC with number n
	JPN	<address></address>	Following a compare instruction, jump to <address> if the compare was False</address>
	LSL	#n	Bits in ACC are shifted n places to the left. Zeroes are introduced on the right hand end
	LSR	#n	Bits in ACC are shifted n places to the right. Zeroes are introduced on the left hand end
	OUT		Output to the screen the character whose ASCII value is stored in ACC
	END		Return control to the operating system
<label>:</label>	<op code=""></op>	<operand></operand>	Labels an instruction
<label>:</label>	<data></data>		Gives a symbolic address <label> to the memory location with contents <data></data></label>

An algorithm stores a 3-character word. It takes each character in turn, multiplies its value by 2 and outputs the new character.

Complete the following assembly language program for the algorithm using the instruction set provided on the previous page.

	Instruction		Comment				
Label	Op code	Operand	Comment				
			// initialise Index Register to 0				
	LDX	character	//]				
			-// load character and multiply by 2				
	OUT		// output the new character				
	INC	IX	// increment the Index Register				
	LDD	count					
	STO	count	// loop 3 times				
	CMP	#3					
		LOOP					
	END		// end program				
count:	0						
character:	B01000001 B10001110						
			// the 3-character stored word				
	в01000100
