Paper 2 AS Level Structured Questions

May/June 2019

1 hour 15 minutes

Candidates answer on the Question Paper.

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer **all** questions.

Electronic calculators may be used.

You may lose marks if you do not show your working or if you do not use appropriate units.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

Answer all questions.

1 (a) Antibody molecules are proteins that show primary structure, secondary structure, tertiary structure and quaternary structure.

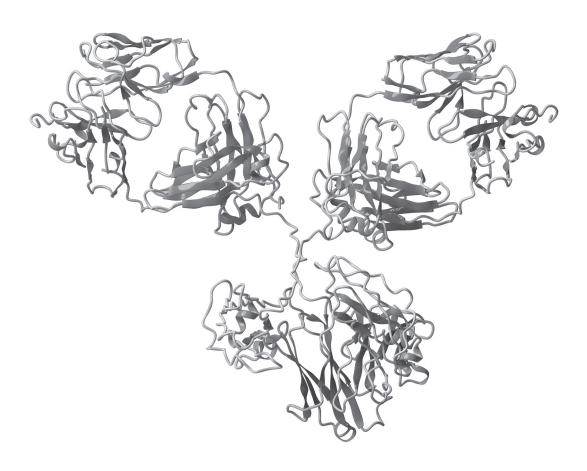

Fig. 1.1

molecule.
secondary structure
tertiary structure

[3]

Describe how Fig. 1.1 shows the secondary structure and tertiary structure of the antibody

Fig. 1.2

(i)	The hybridoma	cell	in	Fig.	1.2	synthesises	and	secretes	molecules	of	а	monoclonal
	antibody.											

State the roles of the structures labelled ${\bf X}$ and ${\bf Y}$ in the production of antibody molecules in the hybridoma cell.

X		٠.
		٠.
Υ		
		• •
	[2	2

(ii)	The hybridoma method for the production of monoclonal antibodies involves a number of stages. One of these stages is the formation of hybridoma cells.
	Outline the stage in which hybridoma cells are formed.
	[3]
(iii)	Outline the use of monoclonal antibodies in the treatment of disease.
	[3]
	[Total: 11]

BLANK PAGE

2 Linoleic acid is an unsaturated fatty acid that is found in some triglycerides and some phospholipids.

Phospholipids are components of cell membranes.

Fig. 2.1 shows a molecule of linoleic acid.

Fig. 2.1

(a) The composition of cell membranes of plants changes in response to changes in temperature.

At the start of the cold season there is an increase in the proportion of phospholipids with unsaturated fatty acids in the chickpea, *Cicer arietinum*. Chickpea plants that do not make this change do not survive.

Suggest how the increase in the proportion of phospholipids with unsaturated fatty acids helps plants, such as chickpea, survive decreases in temperature.
[2]

(b)	(i)	State why triglycerides and phospholipids cannot be described as polymers.
	(ii)	State two differences in the structure of triglycerides and phospholipids.
		1
		2
		[2]
(c)	Plat	relets metabolise linoleic acid to produce a molecule known as thromboxane.
		omboxane is released by platelets when blood loss occurs. Thromboxane acts on smooth scle cells in the walls of arteries. This causes arteries to constrict, which reduces blood '.
	Ехр	lain why the constriction of arteries following blood loss is an example of cell signalling.

3 Neutrase® is an enzyme that is used to hydrolyse proteins in solution. When the enzyme is mixed with a 2% protein solution the reaction mixture changes from white to colourless.

A student carried out an experiment to find the effect of copper sulfate and potassium sulfate on the activity of Neutrase®.

The student made four reaction mixtures in test-tubes **A** to **D**. Test-tubes **A** to **C** contained equal volumes of protein solution and $0.1\,\mathrm{cm}^3$ of solutions of copper sulfate or potassium sulfate. Test-tube **D** contained the same volume of protein solution and $0.1\,\mathrm{cm}^3$ of water.

 $0.5\,\mathrm{cm^3}$ of a 1% Neutrase® solution was added to test-tube **A** and immediately placed into a colorimeter. The colorimeter was used to measure the intensity of light that is absorbed by the solution (absorbance) over 100 seconds. The procedure was repeated with the other reaction mixtures, **B**, **C** and **D**.

The results are shown in Fig. 3.1.

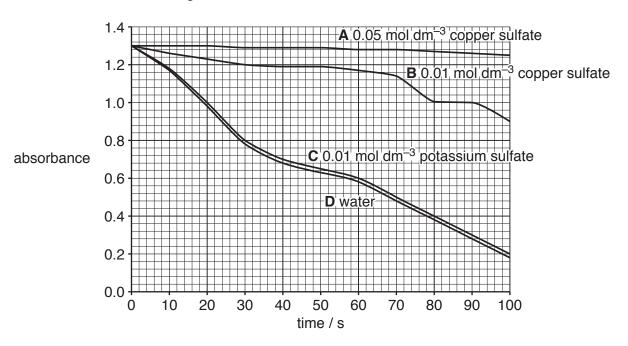

Fig. 3.1

(a)	(1)	is a suitable method for determining the activity of Neutrase®.	S

			•••

		9
	(ii)	With reference to Fig. 3.1:
		 describe the effects of copper sulfate solution and potassium sulfate solution on the activity of Neutrase® suggest explanations for the effects that you have described.
		[5]
(b)		strase ${\mathbb B}$ can be immobilised in alginate. Immobilised Neutrase ${\mathbb B}$ is used in the food industry roduce foods with high nutritional content.
		lain the advantages of using immobilised enzymes, such as Neutrase $^{\rm I\!R}$, compared with $^{\rm I\!R}$ g the same enzymes free in solution.

[Total: 9]

- 4 Meristematic tissue is found in the growing regions of plants, such as shoot tips. Meristematic cells have a similar role to stem cells in animals.
 - Fig. 4.1 shows some of the stages in the formation of a mature phloem sieve tube element and companion cells from a meristematic cell.

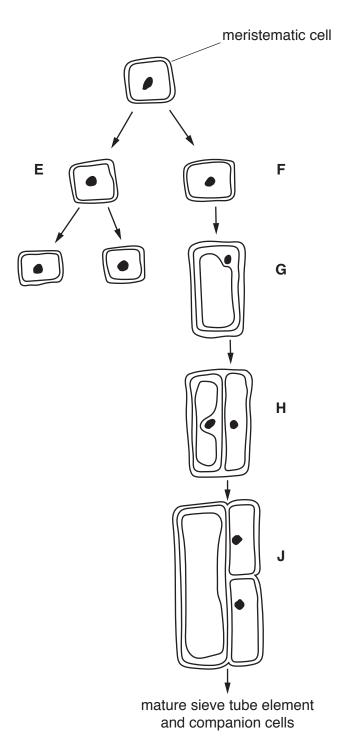

Fig. 4.1

(a)	Cells E and F in Fig. 4.1 are daughter cells produced when the meristematic cell divides in the shoot tip.											
	Explain why it	Explain why it is important that one of the daughter cells (cell E) is a meristematic cell.										
			[1]									
(b)	Complete Tab	le 4.1 to describe the changes that are shown in Fig. 4.1 between stage	s:									
	F and GG and HH and J.											
		Table 4.1										
	stages	description										
	F and G											
	G and H											
	H and J											
(c)	Explain how the	ne structure of a mature sieve tube element is related to its function.	[3]									
(0)	Explain now ti	le structure of a mature sieve tube element is related to its function.										

.....[4]

	(a)	Describe the functions of companion cells in transport in the phloem.	
			[2]
		[Total:	10]
5	(a)	The mammalian circulatory system is described as a closed double circulation.	
		Explain why it is called a <i>closed</i> and <i>double</i> circulation.	

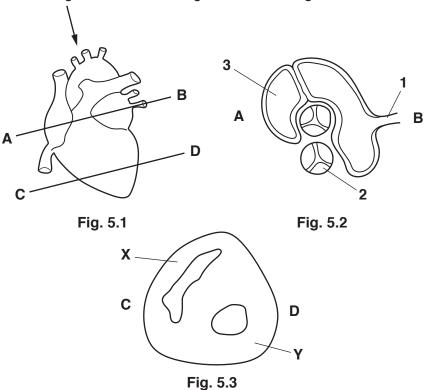

double

(b) Fig. 5.1 shows a drawing of an external view of a mammalian heart.

Two cross-sections were made of the heart:

- section 1 was made across the line A-B.
- section 2 was made across the line C-D.

Drawings of the two sections were viewed from above as shown by the arrow on Fig. 5.1. Fig. 5.2 is a drawing of section **A–B**. Fig. 5.3 is a drawing of section **C–D**.

	(i)	Name structures 1, 2 and 3, as shown in Fig. 5.2.
		1
		2
		3
		[3]
	(ii)	Explain why the wall of chamber \mathbf{Y} is thicker than the wall of chamber \mathbf{X} , as shown in Fig. 5.3.
		[3]
(c)	Exp cycl	lain how the contractions of the chambers of the heart are coordinated during one cardiac e.
		[4]
		[Total: 12]

- 6 (a) The DNA in the nucleus is known as nuclear DNA.
 - (i) In the cells of the grasshopper, *Chorthippus brunneus*, 20% of the nucleotides in nuclear DNA contain thymine.

Calculate the percentage of nucleotides in the nuclear DNA of *C. brunneus* that contain guanine **and** explain your answer in terms of the structure of DNA.

ercentage	
xplanation	ехр
[3]	
) State another location, other than the nucleus, where DNA occurs in cells of <i>C. brunneus</i> .	(ii)
[1]	

(b) Fig. 6.1 is a diagram of a molecule of tRNA.

The region labelled **R** shows detail of part of the tRNA molecule.

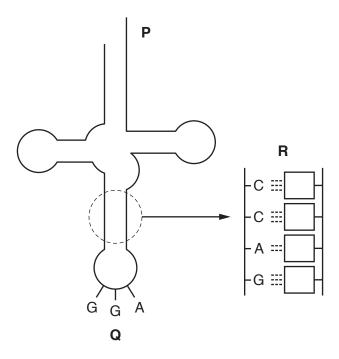

Fig. 6.1

(i)	Complete Fig. 6.1 by writing the sequence of bases in the region labelled R .	[1]	
(ii)	State the name of region Q and explain the role of region Q in translation.		
name			
exp	planation		
		[3]	
(iii)	State the function of region P .
